runc check if.apk file is well runc use --whitelist flag to put some files in the path as exception for conversion runc whitelist command runc convert command Is there a way to perform this conversion with an external command or program? Thanks for any help! A: Your options are limited, since the only "official" way to convert a Docker image into a statically linked executable is to: run your docker image in privileged mode strip all of the runtime stuff If you have your own custom image, you could easily add this functionality as part of a build step. There's no longer a price barrier to entry for creating your own MMO, but that doesn't mean it's not easy to become a millionaire. The latest crop of Kickstarters, which have been a growing phenomenon, are a good indicator of what you need to do to create an MMO that people will pay a subscription fee to play. You might have heard of some of the more popular games that have come from this niche genre: Minecraft and Terraria. Everyday MMO:

Game development from the underground Kickstarter projects are most definitely a niche type of endeavor. They're actually a pretty big business, with a $1.6 billion funding industry according to Techcrunch. But the way most people fund projects is through the Kickstarter website, which allows you to put up a couple of hundred bucks to fund your game project. The funding goals, which you can read about on the project page, are fairly easy to read; they usually set a few thousand dollars as the target to fund the project. The Kickstarters are usually smaller than most companies, and that's partly why they're so easy to fund. They're just a few hundred dollars, and that's not a lot of money for a game company. It's also a nice middle ground for people who are hesitant to commit to full-blown game development. Not all Kickstarters are just fun or creative projects. They're actually a popular way for people who want to put together a serious game. Black Box Entertainment, makers of the multi-million dollar winning PC game Spore, was able to fund its project through Kickstarter in a month or two. The game is still in development, but is scheduled for a 2013 release date, and will be a real-time strategy game with animal characters and the ability to genetically engineer the game world. 82157476af
